ROLL UP HOSE COLLECTOR

Machine for **collecting and winding the irrigation hose** from the field.
Fixed with the third point to the tractor, work raised from the ground.

STRUCTURE AND OPERATION

- 1) Main frame
- 2) Third point
- 3) Operator platform
- 4) Operator protections
- 5) Command console
- 6) Hydraulic connections to the tractor

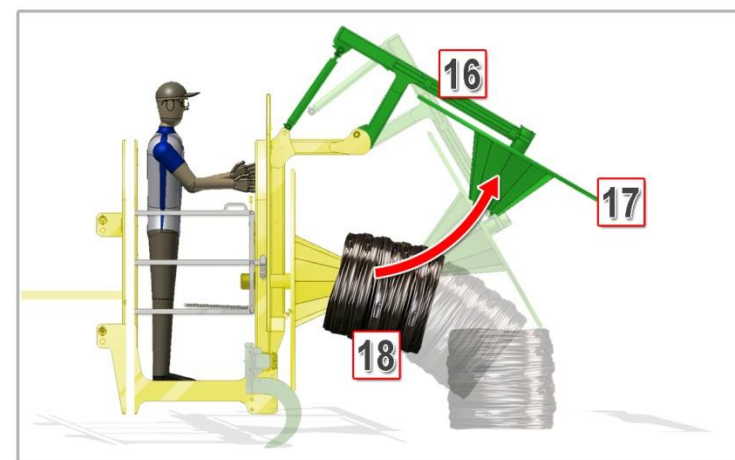

STRUCTURE AND OPERATION

The **coil reel roller (14)** is driven by a **hydraulic motor** powered directly by the tractor's hydraulic system. It is possible to adjust the rotation speed thanks to a **lever flow regulator (15)** placed in the operator's control panel.

Thanks to the **horizontal and vertical hoses conveyor rollers (12)**, we bring to the **roll reel roller (13)**, several hoses simultaneously, creating a single collection reel.

Thanks to the **tilting opening mechanism (16)** of the **hose reel roller (17)**, the unloading of the bundle of the collected hoses (18) becomes simple and immediate.
