SXC BRUSHING MACHINE

Machine for cleaning stump.

After cutting and harvesting wild grafted rootstocks, organic residues of various kinds remain on the ground (branches, leaves etc ...)

These, if left on the ground, could eventually form molds and rot around the mother plants.

To remedy the problem, Oliveragro has a cleaning machine for the stump.

STRUCTURE AND OPERATION

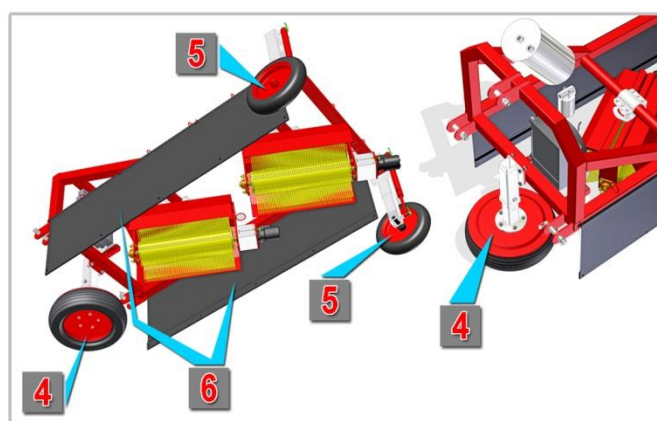

The **SXC Brushing Machine** consists of:

A **supporting frame (1)**, equipped with a third **point connection (2)**.

The two main **brushes (3)**, positioned one in the other and adjustable, are powered by hydraulic motors.

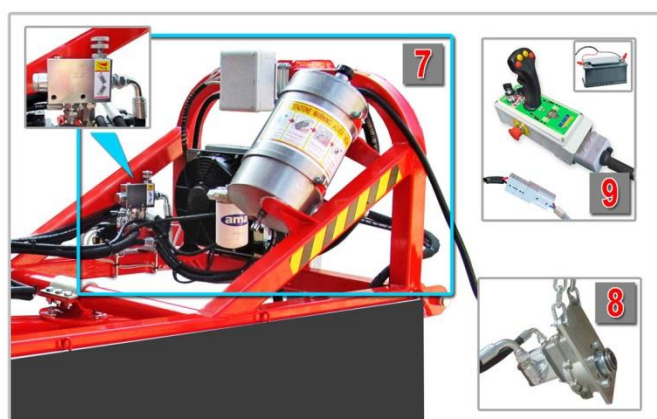

By rotating at variable speed, they execute the cleaning of the stump.

To fix the position of the brushes in height, the machine has a rubberized leveler (4) with variable height.

Two rear wheels (5), hydraulically adjustable in height, stabilize the machine.

Two **curtains (6)**, block the material worked by the rotating brushes, at the side edges of the machine, avoiding it to fall on the neighboring rows.

The **SXC Brushing machine** is equipped with an **autonomous electro-hydraulic system (7)**, with an oil tank, a heat exchanger, a brush speed regulator.

It uses the driving force of the tractor thanks to the **quick-coupling multiplier pump (8)**.

A **control console (9)**, allows to manage, directly from the cab of the tractor, all the movements necessary to ensure the correct use of the machine.
